

Technical Task Submission Notes

1. Overview

This document outlines the approach, tools, and implementation of the system developed as part of the technical task. The system is built as a **web application** that is publicly accessible and connected to a database for storing user input, generated results, and logs.

2. Live System

- Application URL: <https://sales-ai-page-generator.vercel.app/> (email: test@test.com, pass 123456)
- Status: Online & publicly accessible
- Environment:
 - Frontend: *(React)*
 - Backend API: *(Laravel API)*
 - Database: *(MySQL)*

The system:

- Is not running on localhost
 - Is fully functional
 - Is connected to a database
-

3. Technical Approach

a. Architecture

The application follows a **client-server architecture**:

- Frontend handles the user interface
- Backend provides API services and business logic
- Database stores application data

b. System Flow

1. User accesses the application via browser
 2. User submits input data
 3. Data is sent to the backend API
 4. Backend processes and stores data in the database
 5. Results are returned and displayed to the user
-

4. Tools & Technologies

Frontend

- React JS
- Tailwind CSS
- Axios

Backend

- Laravel
- RESTful API

Database

- MySQL

Deployment

- Frontend: Vercel
 - Backend & Database: Niagahoster
-

5. Key Features

- User input form
 - Data processing via API
 - Database integration
 - Responsive UI (desktop & mobile)
 - Input validation and error handling
-

6. UI/UX Considerations

- Clean and intuitive interface
 - Focus on usability and accessibility
 - Fully responsive across devices
 - User feedback (loading, success, error states)
-

7. Video Explanation

YouTube Link: https://www.youtube.com/watch?v=IGR_SK4tLjY

The video includes:

- System architecture explanation
 - Application demo
 - Explanation of logic and implementation
-

8. Additional Notes

- The system is designed with scalability and maintainability in mind
 - Code is structured in a modular way for easier future development
 - APIs are reusable for potential feature expansion
-

9. Conclusion

This project demonstrates a complete end-to-end web application implementation, covering frontend, backend, database integration, and deployment, with a focus on performance, usability, and clean code practices.
